

ABSTRACT

A post-mix container provided with an upper container body and a lower container body. The upper container body has a coverable first opening on a proximal end and the lower container body has a coverable second opening on a proximal end. The proximal ends of the upper and lower container bodies may be moved axially toward each other so that covering of the second opening in the lower container body is removed and then the covering of the first opening in the upper container body is removed, after which the contents of the upper and lower container bodies can be mixed with each other.
